Pedagogical view: Educational practice - Basis / values

Most of my teaching involves instructing graduate and undergraduate students in the fields of electronics and mechatronics. The first semester courses are especially challenging due to the large number of students with different backgrounds. I have encountered in the same class, students with only very basic knowledge of physics, while other students have a university degree. The standard theoretical teaching in engineering often prepares the students to apply equations to solve standard textbook problems, however, it does not provide them the fundamental understanding of the physics of the equations. Therefore, most students have problems when faced with “non-standard” problems, since they do not see that a certain equation would also apply in such situations, i.e. they are not able to generalize from the equations.

When I work with the theoretical aspects, I strive to teach the students not only how to solve standard textbook problems, but also to achieve a more fundamental understanding of the physics of the problem. In other words, I aim to evolve the students' learning from surface to deep learning using approaches such as practice learning and constructivism. The practice learning method for teaching the theoretical aspects provides learning through lecturing, discussions, and demonstrations, while constructivism is an approach to learning which holds that people actively construct or make their own knowledge. In my lectures, the practice learning is also based on the use of e-learning techniques e.g. Poll Everywhere, while constructivism is implemented using hands-on experiments.

I believe that the student's difficulties in understanding the physics of equations rise from the fact that they do not see the application/need of this outside the classroom. Therefore, the hands-on activities enable the students to construct their own understanding of the subject and visualize the applicability of the theory, while using different e-learning techniques to constantly activate the students during the theoretical lectures. In addition, I also use e-learning tools to follow the students' development during the lectures.

I have compared the students' performance during a semester when hands-on and e-learning activities were used with a previous semester when these activities were not applied. When using these learning techniques, I notice an increase in students' participation and interest in the lectures. Also, the examinations show that the use of hands-on and e-learning techniques resulted in a significant improvement in the students' performance. Therefore, in the future, I will continue using such techniques and work to implement more of these activities in my lectures.

I believe that this combination of techniques enables me to teach students coming with different backgrounds in an optimum manner, filling the gaps in the understanding for the more advanced students and, simultaneously, bringing the students that lacked the basic physics up to the required level. I think that the use of e-learning techniques increase students' participation and focus in class by supporting discussions and sharing of experiences between peers and/or me, develop a critical analysis of the hands-on experiment, and therefore stimulate the students to reflect on the fundamental meaning of the equations.
