WORKSHOP SUMMARY

Workshop 29
Advances in Musculoskeletal Regeneration Research

Proposed by: Danish–USA Joint Workshop

Workshop Leader

Prof. Ming Ding,
Department of Orthopaedic Surgery and Traumatology,
Odense University Hospital, Institute of Clinical Research,
University of Southern Denmark, Odense, Denmark
E-mail: ming.ding@rsyd.dk

Tissue regeneration is the progression of renewal, regeneration and growth. Tissue engineering of musculoskeletal tissues, particularly bone, cartilage and tendon, has been the topic of substantial research over the past two decades. Recently, tissue engineering strategies have included gene therapy and stem cells. Gene transfer has been suggested to improve repair and regeneration of tissue at sites of injury. This process enables local, sustained and potentially regulated expression of therapeutic gene products including morphogens, growth factors and anti-inflammatory agents.

Stem cells have been introduced into the field of tissue engineering due to their high proliferative, synthetic, and immunomodulatory activities as well as their potential to differentiate to the target cell types and undergo genetic modification. Stem cell-based therapeutic approaches offer great potential to promote tendon repair and regeneration.

Stimulating bone regeneration particularly in osteoporotic bone has been a challenge. Tissue engineering of bone regeneration has focused on bone graft substitute materials and developments of biodegradable scaffolds. A promising strategy of engineering functional bone seems to be using combinations of stem cells, scaffolds and bioactive factors.

Despite technological advances have improved orthopaedic implants and surgical techniques for bone reconstruction, the improvements in surgical techniques to reconstruct bone have been limited by the paucity of autologous materials available and donor site morbidity. Recent advances in the development of substitute materials have provided attractive alternatives to autograft and allograft grafting materials for restoring the form and function of injured bone.

Speakers

Speaker 1: Expedited gene therapy approaches to bone healing
Prof. Christopher H. Evans,
Rehabilitation Medicine Research Center, Mayo Clinic,
Rochester, MN, USA
E-mail: evans.christopher@mayo.edu

Speaker 2: Advances in stem cell-based therapeutic approaches to tendon repair and regeneration
Prof. Hui (Herb) B. Sun,
Departments of Orthopaedic Surgery and Radiation Oncology, Albert Einstein College of Medicine, Bronx, NY, USA
E-mail: herb.sun@einstein.yu.edu

Speaker 3: Stimulating bone regeneration in osteoporotic bone
Prof. Ming Ding,
Department of Orthopaedic Surgery and Traumatology,
Odense University Hospital, Institute of Clinical Research,
University of Southern Denmark, Odense, Denmark
E-mail: ming.ding@rsyd.dk

Speaker 4: Clinical experiences of bone stimulation in orthopaedic surgery and traumatology
Prof. Søren Overgaard,
Orthopaedic Research Unit, Department of Orthopaedic Surgery and Traumatology, Odense University Hospital, Institute of Clinical Research, University of Southern Denmark, Odense, Denmark
E-mail: soeren.overgaard@rsyd.dk
