## Forskningsområde

I am an associate professor in Engineering working at the University of Southern Denmark. I am passionate about novel technology and technological innovation for the benefit of society. My research interests are robotics and other complex cyber-physical systems. My current work spans the areas of sensing and perception, wireless sensor networks and autonomous drone risk assessments, failsafe systems and aerial collision avoidance.

## Teaching portfolio

### Educational view

What makes a talented engineer? I believe he or she possess good theoretical and professional skills and in addition a number of generic skills such as the ability to work analytically and methodically, to think creatively and innovative and to work in inter-disciplinary teams. To embrace these skills I see myself as a facilitator of learning, rather than an expert who feeds knowledge to the students. In my teaching I try therefore to support the students in achieving these skills themselves, and to encourage them to take responsibility for their own learning.

My approach is often laboratory-based and project oriented teaching. I find that this motivates the engineering students and I often receive positive feedback in the form of new inspiration, great ideas to alternative approaches etc. not to mention the students' enthusiasm. This is very motivational to me as well.

### Teaching experience

I have since 2017 taught the mandatory courses UAS Technology (Spring semester) and Unmanned Aircraft Systems Design (Fall semester) for the UAS Technology Master specialization. Before this I have taught the courses Robot Systems Design, Expert in Teams, Introduction to UAS Technology, Design and Development of Field Robots for Plant Nursing.

Since 2014 I have contributed to the supervision of 4 PhD students, I have supervised 22 MSc students (hereof 5 as co-supervisor), 2 Diploma students, 11 BSc students and 4 individual student projects. The majority of these have been in UAS technology and some in Field Robotics and Internet of Things (IoT).

During 2015 and 2016 I was teaching UAS technology as part of the new drone pilot certificate introduced in Denmark at that time. This activity was in support to the UAS Flight Academy established at HCA Airport. Students were employees from the industry and organizations.

### Other educational activities

I have been part of the education committee for Robotics since 2014. In this role I have made key contributions to the establishment of a MSc specialization in UAS technology. Initially I established a 5 ECTS elective interdisciplinary course in drone technology conducted in the Spring 2015. Based on the results I contributed to establishing a Master specialization in UAS technology. My contributions included curriculum design, developing course descriptions for all new courses, negotiations with various stakeholders etc. The Master specialization became a reality in the Fall 2015.

In 2014-2015 I played a major role in the redesign of the course Robot Systems Design (RSD) for 9th semester robotics students. The aim of the course was to enable the students to implement a complex industrial robotic installation using the knowledge and experience they have gained throughout their study. The course previously focused on industrial robotics only. My contribution to this redesign process was the inclusion of mobile robots to transport production parts in the industrial environment and collaborate with the industrial robots. This development of the course content was welcomed by both representatives from the industry and the students, as this resembled the current state of the art.

### Educational training

I have in 2015 completed the SDU University Lecturer Training Programme. I have in 2016 been certified as Teaching in English competency at C1 level in spoken English.
